Semptify Legal Filing Module

VS Code Copilot Agent — Integration Handoff Brief

Prepared by: Bradley | Date: April 2, 2026 | Category: Technical Integration Instructions
Project: Semptify FastAPI | Repository: github.com/Bradleycrowe

This document is a complete integration handoff for wiring the Legal Filing Module into the Semptify FastAPI application. It is designed to be consumed by VS Code Copilot Agent mode. Paste the relevant sections into Copilot Agent chat to execute each phase.

Phase 0: Prerequisites

- **Project root:** `C:\Semptify\Semptify-FastAPI`
- **Framework:** FastAPI (migrated from Flask, April 2026)
- **Python:** 3.10+
- **Package manager:** pip (virtualenv at `.venv`)
- **GitHub:** Bradleycrowe
- The module source files are packaged in an XLSX spreadsheet artifact. Column A = relative file path, Column B = full source code. They must be extracted first (see Phase 1).

Phase 1: Extract Module Files from XLSX

The 24 source files are stored in an Excel workbook (`Semptify_LegalFilingModule_Source.xlsx`). Run this extraction script to write them to disk. The script reads Column A (relative file path) and Column B (full source code) from each row, then writes the files to the `legal_filing_module/` directory.

extract_module.py — save to C:\Semptify\Semptify-FastAPI\ and run

```
"""
Extract Legal Filing Module source files from XLSX package.
Run: python extract_module.py
Expects: Semptify_LegalFilingModule_Source.xlsx in the same directory.
"""
import os
from openpyxl import load_workbook

XLSX_PATH = os.path.join(os.path.dirname(__file__), "Semptify_LegalFilingModule_Source.xlsx")
```
